

# Simple CSS Flexbox Assignment for Beginners

In this assignment, you will practice basic Flexbox concepts using simple HTML and CSS. Focus on using properties like `display: flex`, `justify-content`, `align-items`, and `flex-direction`. Try to complete all tasks step-by-step.

1. Create a row of three colored boxes using Flexbox.
2. Make a horizontal navigation menu with four links spaced equally.
3. Center a single box both vertically and horizontally in the browser window.
4. Stack three boxes vertically using Flexbox.
5. Create two boxes: one should take more space than the other using `flex-grow`.
6. Make a row of buttons with equal spacing between them using `justify-content`.
7. Create a box with three items and align one item to the right using `margin` or `align-self`.
8. Build a layout with two sections side by side: one for text, one for an image.
9. Create a row of four boxes that wrap to the next line on small screens.
10. Reorder three boxes using the `order` property without changing the HTML.
