NARROWING CONCEPT TASK: -

List of tasks related to Narrowing Concept –

Question 1. Find the output of below program.

```
public class Test
{
    public void m1(Object o)
    {
        System.out.println("m1---Object");
    }
    public void m1(String s1)
    {
        System.out.println("m1---String");
    }
    public static void main (String args[])
    {
        Test t=new Test ();
```

```
        //Call all the possible methods and print the msg.

    }
}
```

Question 2. Suppose we have two child class of one Parent class then what will happen.

```
public class A
{

}
public class Test
{
    public void m1 (Object o) //parent class of all the classes
    {
        System.out.println ("m1---Object");
    }
    public void m1 (String s1) //child class of object class
    {
        System.out.println ("m1---String");
```

```
 }
public void m1 (String s1) //child class of object class
{
        System.out.println ("m1---String");
}
public void m1 (A a) //child class of object class
{
        System.out.println ("m1---A");
}
public static void main (String args[])
{
        Test t=new Test();
        t.m1(null);//this line gives the error (Ambiguty error)
bcoz of compiler confused there are two child.
 // where passed the null value.
//this time we have to type cast child class also to call value
        t.m1((A)null);//m1---A
        t.m1((String)null);//m1---String
        t.m1((Object)null);//m1---Object  }
  }
```

Question 3. Check the Output.

```
public class Test {
    public void m1(Number n) {
        System.out.println("m1__Number");
    }
    public void m1(int x) {
        System.out.println("m1___int");
    }

    public static void main (String[] args) {
        Test t=new Test ();
        t.m1(0);
        t.m1((Number)0);
    }
}
```

Question 4. Check the Output.

```
public class A {
}
```

```
public class B extends A {

}
public class C extends B {

}
public class Test {
    public void m1(A a)
    {
        System.out.println("In A parameter");
    }
    public void m1(B b)
    {
        System.out.println("In B parameter");
    }
    public void m1(C c)
    {
        System.out.println("In C parameter");
    }
    public static void main (String[] args)
```

```
{
        Test t=new Test ();
        // Call all the possible methods and get the output
  }
}
```
