MethodWithReturnType By Kunal Sir

Assigments

Question 1.Write a method named subtract that takes two integers as parameters and returns the result of subtracting the second integer from the first. Implement this method in a class named ArithmeticTask and demonstrate its functionality in the main method .

Question 2: Write a method named isPositive that takes an integer as a parameter and returns true if the number is positive and false otherwise. Implement this method in a class named NumberChecker, demonstrate its functionality in the main method, and take input using the Scanner class.

Question 3: Create a method called calculatePerimeter that takes two double parameters representing the length and width of a rectangle and returns the perimeter. Implement this method in a class named Rectangle and test it in the main method.

Question 4: Write a method named findMinimum that takes three integers as parameters and returns the smallest of the three. Implement this method in a class named MinFinder and demonstrate its functionality in the main method.

Question 5: Write a method named calculateSimpleInterest that takes three parameters: principal (double), rate of interest (float), and time (int). The method should return the calculated simple interest. Implement this method in a class named InterestCalculator and demonstrate its functionality in the main method.

Question 6: Create a method called reverseInteger that takes an integer as a parameter and returns its reverse. For example, if the input is 123, the output should be 321. Implement this method in a class named IntegerReverser and test it in the main method.
