

Axios Library Assignment

Part A – Multiple Choice Questions

1. Axios is primarily used for _____ in React applications.
a) Database Management b) Making HTTP Requests c) CSS Styling d) DOM Manipulation
-

2. The command to install Axios in a React project is _____.
a) npm start axios b) npm run axios c) npm install axios d) npm axios install
-

3. Which of the following must be imported to use Axios?
a) import http from 'axios' b) import axios from 'axios' c) import AxiosAPI from 'axios' d) import data from 'axios'
-

4. Axios supports which data format by default?
a) XML b) CSV c) JSON d) HTML
-

5. The method used to send GET requests using Axios is _____.
a) axios.fetch() b) axios.get() c) axios.call() d) axios.read()
-

6. To send data to the server, which Axios method is used?
a) axios.get() b) axios.post() c) axios.fetch() d) axios.send()
-

7. To update existing data on the server, we use _____.
a) axios.get() b) axios.patch() c) axios.put() d) Both b and c
-

8. To delete data using Axios, we use _____.
a) axios.remove() b) axios.destroy() c) axios.delete() d) axios.post()
-

9. The `then()` method is used to handle _____ responses.
a) error b) success c) pending d) invalid
-

10. The `catch()` method handles _____ responses.
a) success b) error c) null d) warning
-

11. What is the purpose of Axios interceptors?
a) Modify requests/responses globally b) Manage state c) Handle routing d) Change component hierarchy
-

12. Which of the following is NOT an Axios feature?
a) Intercept requests b) Promise-based API c) Server creation d) Cancel requests
-

13. The response from Axios is usually accessed using which property?
a) response.data b) response.body c) response.info d) response.list
-

14. In Axios, error messages can be caught using _____.

- a) res.message b) error.message c) data.error d) catch.data
-

15. What does the `useEffect()` hook do in Axios-based React components?

- a) Runs API calls when component renders b) Handles input fields c) Styles components d) Creates context
-

16. What is the main purpose of `setStudents(res.data)` in your `ViewStudents` component?

- a) To delete data b) To update state with server response c) To create new users d) To initialize API
-

17. In a CRUD operation, which Axios method corresponds to the “Create” action?

- a) `axios.put()` b) `axios.post()` c) `axios.get()` d) `axios.delete()`
-

18. In a CRUD operation, which Axios method corresponds to “Read”?

- a) `axios.get()` b) `axios.post()` c) `axios.put()` d) `axios.delete()`
-

19. To perform “Update” in CRUD, we can use _____.

- a) `axios.put()` b) `axios.post()` c) `axios.get()` d) `axios.delete()`
-

20. The “Delete” operation in CRUD uses which method?

- a) `axios.destroy()` b) `axios.remove()` c) `axios.delete()` d) `axios.end()`
-

21. Axios can cancel a request using _____.
a) cancelToken b) break c) return d) stopAPI()

22. What type of value does Axios return by default?
a) Array b) Promise c) String d) JSON

23. What does `axios.get('http://localhost:5000/students')` return on success?
a) HTML file b) Promise object with response data c) JSON String only d) undefined

24. What is the best place to perform Axios calls inside a React functional component?
a) Inside render b) Inside return c) Inside `useEffect()` d) Inside `index.js`

25. If an API call fails, which method allows handling the error?
a) `catch()` b) `finally()` c) `then()` d) `throw()`

Part B – Practical Problem Statements

1. Practice Question – GET Method

Create a React component named **viewAllStudents**.

Use **axios.get()** to fetch all student records from

`http://localhost:5000/students`

and display them in a table format with columns:

`Id, Full Name, Email, Age, Batch No, Mode.`

2. Practice Question – GET (Single Record)

Create a React component named **SearchStudentById**.

Take **Student ID as input** from the user.

When the user enters an ID, use

`axios.get("http://localhost:5000/students/{id}")`

to fetch and display only that student's details.

3. Practice Question – POST Method (Create)

Create a React component named **AddStudent**.

Take inputs for `Full Name, Email, Age, Batch No, and Mode.`

On button click, send this data to the server using

`axios.post("http://localhost:5000/students", studentData)`

and display a success message when the record is added.

4. Practice Question – PUT Method (Update)

Create a React component named **UpdateStudent**.

Ask the user to enter a **Student ID** along with updated details like Full Name, Email, or Age.

Use `axios.put("http://localhost:5000/students/{id}", updatedData)` to update the record on the server.

Display a confirmation message on successful update.

5. Practice Question – DELETE Method

Create a React component named **DeleteStudent**.

Take a **Student ID** from the user.

On clicking the “Delete” button,

call `axios.delete("http://localhost:5000/students/{id}")` to delete that student record from the server.

Show a message confirming deletion.

6. Practice Question – CRUD Integration

Create a React component named **ManageStudents** that performs all four CRUD operations using Axios:

- Add new student (POST)
- View all students (GET)
- Update student (PUT)
- Delete student (DELETE)

Use buttons and input fields for each operation in a single UI.
