

React 18 Warning Fix: ReactDOM.render → createRoot

■ Problem

In React 18+, the old method ReactDOM.render(component, container) has been deprecated.

When you use it, React shows this warning:

Warning: ReactDOM.render is no longer supported in React 18. Use createRoot instead.

■ Solution — Use createRoot from react-dom/client

Starting with React 18, you must create a root using ReactDOM.createRoot() instead of ReactDOM.render().

■ Fixed Code Example

React 18 Example

```
const h1Ref = React.createElement('h1', { id: 'heading' }, "Welcome to CJC");
const root = ReactDOM.createRoot(document.getElementById('root'));
root.render(h1Ref);
```

■ Explanation

- Old React (≤17): ReactDOM.render(element, container)
- New React (18+): const root = ReactDOM.createRoot(container); root.render(element);
- Uses legacy rendering engine vs concurrent rendering engine
- Deprecated in React 18+ and will be removed in the future

■ Documentation Reference

React official migration guide:

<https://react.dev/blog/2022/03/08/react-18-upgrade-guide#updates-to-client-rendering-apis>

■ Summary

- Issue: ReactDOM.render no longer supported in React 18
- Solution: Replace with ReactDOM.createRoot(container).render(element)
- Why: React 18 introduced a new concurrent rendering system

- Benefit: Faster updates, better performance, new features like Suspense, transitions, etc.
