Complete Java Classes

by Kunal Sir

What Is Class?

1. Class is a different type of logical entity.
2. It is used to design template or blueprint.
3. With class keyword we can design class in java.

There are two Types of class: -

1) Inbuild Class: -

This type of classes predefined by the java community.

For Example:

System, String, Scanner class etc.

2) Custom Class: -

This type of classes design from our own purposes.

For Example:

```
public class A
```

```
{
```

```
}
```

```
public class Student
```

```
{
```

```
}
```

Points To Be Remember Before Creating Class in Java: -

Point 1: - When class is public then class name and file name must be same.

For example: -

Java Source Filename → A.java

Java Byte Code File → A.class

public class A

{

Compile Command: javac A.java

Running Command: java A

}

Point 2: - When class is not public then class name and file name can be different.

For example: -

Java Source Filename → A.java

Java Byte Code File → B.class

CJC

Complete Java Classes

by Kunal Sir

```
class B
```

```
{
```

Compile Command: javac A.java

Running Command: java B

```
}
```

Basic Java Program: -

A.java

Create a class named "A":

```
public class A
```

```
{
```

```
    public static void main(String args[])
```

```
    {
```

```
        System.out.println("Welcome to CJC");
```

```
    }
```

```
}
```

CJC

by Kunal Sir

Compile: javac A.java

Run: java A

Output: Welcome to CJC.

What are Methods?

A **method** is a block of code or collection of statements or a set of code grouped together to perform a certain task or operation.

It is used to achieve the **reusability** of code.

Types of Methods: -

There are Four types of methods:

Simple Method: -

Syntax: - AccessModifier ReturnType MethodName()

```
{  
  
}
```

For example: -

CJC

Complete Java Classes

by Kunal Sir

```
public void m1()  
{  
}
```

Simple Parameterized Method: -

Syntax: - AccessModifier ReturnType MethodName(parameter)

```
{  
}
```

For example: -

```
public void m1(int x)  
{  
}
```

Return Type Method: -

Syntax: - AccessModifier ReturnType MethodName()

```
{  
    return --;  
}
```

CJC

Complete Java Classes

by Kunal Sir

For example: -

```
public int m1()  
{  
    return 10;  
}
```

Return Type Parameterized Method: -

Syntax: - AccessModifier ReturnType MethodName(int x)

```
{  
    return x;  
}
```

For example: -

```
public int m1(int x)  
{  
    return x;  
}
```

Important Things to Know: -

CJC

Complete Java Classes

by Kunal Sir

There are 2 important things to know—

Object Creation: -

Syntax: -

```
ClassName referencevariable = new ClassName();
```

For example: -

```
A a = new A();
```

Where:

A -- ClassName

a -- ReferenceVariable / Object

new -- Keyword

Method Calling: -

Syntax: -

```
referencevariable.methodName();
```

For example: -

```
a.m1();
```

Where:

CJC

Complete Java Classes

by Kunal Sir

a -- ReferenceVariable / Object

m1 -- Method Name (m1—Method1)

Basic Program based on method calling and object creation:

```
public class A
{
    public void m1()
    {
        System.out.println("M1 method");
    }
    public static void main(String args[])
    {
        System.out.println("Main Method Start");
        A a=new A(); //Object Creation
        a.m1(); // Method Calling
        System.out.println("Main Method End");
    }
}
```

CJC

Complete Java Classes

by Kunal Sir

Compilation Command: - `javac A.java`

Running Command: - `java A`

Output: - Main Method Start

M1 Method

Main Method End
