

Finally Block in Java:

1. Finally block code will always be executed if they're the problem inside the try block or there is no problem inside the try block.
2. The code which we want to execute compulsorily that type of code we can write inside the finally block.
3. In other words, a finally block contains all the crucial statements that must be executed whether exception occurs or not.

Syntax of Finally Block:

```
try {  
    //statement that may cause an exception  
} catch {  
    //handling the exception  
} finally {  
    //statements to be executed compulsorily  
}
```

CJC

Complete Java Classes

by Kunal Sir

```
try {  
    //statement that may cause an exception  
} finally {  
    //statements to be executed compulsorily  
}
```

Flow diagram of Finally Block:

Uses of Finally Block:

There are different types of uses which is given below-

- Generally, finally block or clause is used for freeing up resources, cleaning up code, database connection closing etc.
- A java finally block is used to prevent resource leak. While closing a file or recovering resources, the code is put inside the finally block to ensure that the resource is always recovered.
- Finally, block is used for terminating threads.

Important Points Regarding Finally Block:

- A finally block must be associated with a try block, you cannot use finally without a try block. You should place those statements in this block that must be executed always.
- Finally, block is optional, as we have seen in previous

by Kunal Sir

sessions that a try-catch block is sufficient for exception handling, however if you place a finally block then it will always run after the execution of try block.

- In normal case when there is no exception in try block then the finally block is executed after try block. However, if an exception occurs then the catch block is executed before finally block.
- An exception in the finally block, behaves exactly like any other exception.
- The statements present in the finally block execute even if the try block contains control transfer statements like return, break or continue.

When does finally block not execute in java?

When we use **System.exit(0);** before the finally block then program will automatically terminate and finally block will not get a chance to execute.
