

Throws Keyword in Java:

1. Throws keyword is used for propagating the exception.
2. Propagating the exception which means give the chance to caller method to handle that exception.
3. Throws keyword we can write with methods and constructor both.
4. The throws keyword in java is used to declare exception that can occur during the execution of a program.
5. It is mandatory to use the throws keyword to list the exceptions that can be thrown.

Syntax of Throws Keyword:

The throws syntax in java which is given below -

throws keyword Vs. try...catch...finally:

- There might be several methods that can cause exceptions. Writing try.....catch for each methods will be tedious and code become long and less-readable.
- Throws is also powerful when you have checked exception (an exception that must be handled) that you don't want to catch in your current methods.
