Method and Variable Compilation Rules:

- Methods and variables running starts from the **Reference Class**.
- Compiler checks methods and variables in reference class or their parent class.
- If it is present then it will get compile otherwise it will give the compile time error.

Method Running Rules:

- Method running starts from the **Constructor Class**.
- If it is present then it will execute the constructor class methods otherwise it will execute their parent class methods.

Variable Running Rules:

by Kunal Sir

- Variable running starts from the **Reference Class**.
- If it is present then it will execute the reference class variables otherwise it will execute their parent class variables.

Need to Know about Reference & Constructor Class:

Suppose we have two class A & B which have parent and child relationship so here parent class is A and child class B then we can create the object with parent reference with child object just like below given example-

A **a** = **new B();**

Where - **A** **a** → Reference Class
 new B(); → Constructor Class

Understanding Program:

```
public class A
{
    int a=10;
    int b=20;
```

by Kunal Sir

```
public void m1()
{
    System.out.println ("m1-A");
}

public void m2()
{
    System.out.println ("m2-A");
}

}

public class B extends A
{
    int a=30;
    int c=40;

    public void m1()
    {
        System.out.println ("m1-B");
    }

    public void m3()
    {
        System.out.println ("m3-B");
    }

}
```

by Kunal Sir

```
public class Test
{
    public static void main (String [] args)
    {
        A a = new B ();

        a.m1();    //m1-A

        a.m2();    //m2-A

        a.m3();    // It will give compile time error.

        System.out.println (a.a);    //10

        System.out.println (a.b);    //20

        System.out.println (a.c);    // It will give compile time error.
    }
}
```
