

Setter and Getter Method in Java:

Setter and Getter are methods used to protect your data and make our code more secure.

Setter and getter make the programmer convenient in setting and getting the value for a particular data type.

Setter in Java: - While setter sets or updates the value (Mutator). It sets the value for any variable used in a class's programs and starts with the word "set" followed by the variable name.

Syntax - setVariableName();

Note – Variable name first character is always capital with setter method

Getter in Java: - Getter returns the value (Accessors), it returns the value of data type int, String, double, float etc. For the program's conveniences, the getter starts with the word "get" followed by the variable name.

Syntax - getVariableName();

Note – Variable name first character is always capital with getter method

Need of Setter and Getter Methods:

When we declare a class member as private then, it becomes non-accessible to any code outside its class, including its subclasses. This feature makes it more secure than other access modifiers like public and protected. By using setter and getter methods, we can control how the private fields of a class are accessed and modified.

Understanding Program:

```
public class SetterGetter
{
    private String name;

    public String getName()
    {
        return name;
    }

    public void setName(String name)
    {
        this.name = name;
    }
}
```

by Kunal Sir

```
public class Test {  
  
    public static void main(String[] args)  
    {  
        SetterGetter obj = new SetterGetter ();  
  
        obj.setName("Welcome to CJC");  
  
        System.out.println(obj.getName());  
    }  
}
```
