MethodWithParamter by Kunal Sir

When we write a method, we use parameters as variables inside the brackets. We use them to send data into the method so it can work with different values each time it runs.

We use method parameters to pass data like numbers, text, arrays, or objects to methods. this is done using pass-by-value, which means the data is copied when passed..

This approach is also used to pass data from a method in one class to a method in another class.

Types of Parameters

- **Primitive Data Types:** int, float, char, etc.
- **Reference Types:** Objects, arrays, etc.

Syntax:

CJC

Complete Java Classes

MethodWithParamter by Kunal Sir

```
public void methodName(parameterType parameterName) {  
    // method body  
}
```

1. This approach is used to pass data from one method to another within the same class.

Method with Primitive Parameters:

Examples:

```
public class Calculator {  
    public void add(int a, int b) {  
        System.out.println(a + b);  
    }  
  
    public static void main(String[] args) {  
        Calculator calc = new Calculator();  
        calc.add(5, 10)  
    }  
}
```

Examples 2:

```
public class CJC{  
  
    public void showInstituteName(String instituteName)  
  
    {  
  
        System.out.println("Institute Name: " + instituteName);  
  
    }  
  
    public static void main(String[] args) {  
  
        Calculator calc = new Calculator();  
        calc.showInstituteName("CJC PUNE BY KUNAL SIR");  
    }  
}
```

Assignment 1

Create RechargeStatus class has a method called checkStatus. This method takes a number called amount and checks if it is 100 or more. If yes, it prints "Recharge is valid." If not, it prints "Recharge is not valid." In the main method, we make an object and use it to call checkStatus(140) to show the result.

Assignment 2

A class named AccountHolder is created. It contains a method called showName, which accepts a String parameter named name. The method prints the account holder's name using System.out.println. In the main method, an object of the AccountHolder class is created using new AccountHolder(), and the showName method is called with the argument "NK" to display the name.

Assignment 3

A class named BranchDetails is created. It contains a method called showBranch, which accepts a String parameter named branchName. The method prints the branch name using System.out.println. In the main method, an object of the BranchDetails class is created using new BranchDetails(), and the showBranch method is called with the argument "CJC KarveNagar By Kunal Sir" to display the branch name.

Assignment 4

A class named DepositSlip is created. It contains a method called printDeposit, which accepts an int parameter named amount. The method prints the deposit amount using System.out.println. In the main method, an object of the DepositSlip class is created using new

DepositSlip(), and the printDeposit method is called with the argument 5000 to display the deposit amount.

Assignment 5

A class named AccountInfo is created. It contains a method called displayAccountNumber, which accepts a long parameter named accountNumber. The method prints the account number using System.out.println. In the main method, an object of the AccountInfo class is created using new AccountInfo(), and the displayAccountNumber method is called with the argument 9876543234555 to display the account number.

Assignment 6

A class named RideApp is created. It contains a method called bookRide, which accepts a String parameter named location. The method prints the ride booking location using System.out.println. In the main method, an object of the RideApp class is created using new RideApp(), and the bookRide method is called with the argument "Airport" to show the ride destination.

Assignment 7

We created a class called SnapChat. Inside it, there is a method named sendSnap that takes a friend's name as a parameter. This method prints

CJC

MethodWithParamter by Kunal Sir

a message saying the snap was sent to that friend. In the main method, we made an object of the SnapChat class and then called the sendSnap method, giving it the name "NK". As a result, the program displays:
Snap sent to: NK.

Assignment 8

We made a class called PorterApp, and inside it there is a method called bookVehicle that takes the name of a vehicle. This method shows a message that the vehicle has been booked. In the main method, we created an object of the PorterApp class and used it to run the bookVehicle method with the vehicle name "Tempo ". When we run the program, it prints: **"Vehicle booked: Tempo "**.

Assignment 9

We created a class named InstaPost. Inside this class, there is a method called addCaption that takes a caption as input. This method prints a message to show that the caption has been added. In the main method, we made an object of the InstaPost class and used it to call the addCaption method with the caption "Enjoying the sunset!". When we run the program, it shows the message: **"Caption added: Enjoying the sunset!"**
