Assignments

Assignment 1: Animal

Create a base class called **Animal** with attributes for species and age using parameterized constructors. Create subclasses **Dog** and **Cat**, adding specific attributes like breed for dogs and color for cats, also using parameterized constructors. Implement a method to display animal details in each subclass. In a **Test** class, create five instances of the subclasses and call the display methods.

Assignment 2: Employee

Create a base class called **Employee** with attributes for name, salary and id using parameterized constructors. Create subclasses **Manager** and **Developer**, adding specific attributes like teamSize for managers and programmingLanguage for developers using parameterized constructors. Implement a method to display employee details in each subclass. In a **Test** class, create five instances of the subclasses and call the display methods.

Assignment 3: Shape

Create a base class called **Shape** with a method calculateArea(). Create subclasses **Circle** and **Rectangle** that implement the method to calculate their respective areas. Include attributes for radius in **Circle** and length
