

Constructors

By Kunal Sir

Assignments

Assignment 1: Laptop Class

Create a **Laptop** class with No Argument constructors

Instructions:

1. Create a class named **Laptop** with the following attributes:
 - **brand** (String)
 - **model** (String)
 - **price** (double)
2. Create a **showLaptopInfo()** method in the **Laptop** class that prints the laptop's details.
3. In the **main** method of the **Test** class, create instances of **Laptop** using constructors and call the **showLaptopInfo()**

Assignment 2: Student Class

Implement a **Student** class with parameterized and demonstrate class-to-class communication.

Instructions:

Constructors

By Kunal Sir

1. Create a class named **Student** with the following attributes:
 - **name** (String)
 - **rollNumber** (int)
 - **email**(String)
 - **course** (String)
2. A parameterized constructor that initializes all three attributes.
3. Create a method **displayInfo()** in the **Student** class that prints the student's details.
4. Create another class named **School** that contains a method **addStudent()** which takes a **Student** object as a parameter and calls the **displayInfo()** method.
5. In the **main** method of the **School** class, create instances of **Student** using constructors and call the **addStudent()** method.

Assignment 3: Product Class

Create a **Product** class with constructors and demonstrate class-to-class communication.

Instructions:

Constructors

By Kunal Sir

1. Create a class named **Product** with the following attributes:
 - **productName** (String)
 - **productID** (int)
 - **price** (double)
2. A parameterized constructor that initializes all three attributes.
3. Create a method **displayProductDetails()** in Product class that prints the product's details.
4. Create another class named **Store** that contains a method **addProduct()** which takes a **Product** object as a parameter and calls the **displayProductDetails()** method.
5. In the **main** method of the **Store** class, create instances of **Product** using constructors and call the **addProduct()** method.

Assignment 4: Bus Class

Implement a **Bus** class with constructors and demonstrate class-to-class communication.

Instructions:

Constructors

By Kunal Sir

1. Create a class named **Bus** with the following attributes:
 - **busNumber** (String)
 - **capacity** (int)
 - **route** (String)
2. A parameterized constructor that initializes all three attributes.
3. Create a method **displayBusInfo()** in class **Bus** that prints the bus's details.
4. Create another class named **TransportCjc** that contains a method **addBus()** which takes a **Bus** object as a parameter and calls the **displayBusInfo()** method.
5. In the **main** method of the **TransportCjc** class, create instances of **Bus** using both constructors and call the **addBus()** method.
