

Fixing node_modules Installation Issue

Many times `node\_modules` installs in the wrong folder (like `C:\Users\Admin`) instead of your project folder. This happens when `npm install` is not run inside the project directory with a `package.json` file. Follow these steps to always fix it and make sure `node\_modules` installs in your project folder.

1. Navigate to your project folder: `cd "C:\Users\Admin\OneDrive\Desktop\Frontend ui-ux git folder\Bootstrap\practice\Alerts2"`
2. Initialize the project if package.json is missing: `npm init -y`
3. Install your dependencies locally (without -g): `npm install bootstrap bootstrap-icons @popperjs/core`
4. Verify installation path: `npm root` → Output should be `your_project_path\node_modules`
5. Delete unwanted global node_modules if created in C:\Users\Admin: `rd /s /q "C:\Users\Admin\node_modules"`

■ Important: Always run npm commands from inside your project folder.

Now, every time you follow these steps, node_modules will always be installed inside your project folder only.
